Sonography
Involving
Gastro-Abdominal
Hemodynamic, and
Trans-Thoracic Ultrasound

	IMAGE AREA	IMAGE ACQUISITION	PROBE
1	Heart	Parasternal Long Axis (PLAX)	Phased
2	Inferior Vena Cava	Subcostal	Phased
3	Lung	Anterior, Lateral, Posterior	Linear
4	Kidney	Longitudinal, Transverse	Curved
5	Bladder	Suprapubic	Curved
6	Dialysis Fistula	Longitudinal and Transverse	Linear

Johns Hopkins **Nephrology** fellowship
POCUS curriculum

Do you know all ?

Sign	Images	Description	Pathology
Sliding sign	Figure 2	Movement between the two layers of the pleura during normal respiration	Normal
A-lines	Figure 6	Hyperechoic horizontal lines parallel to pleural line occurring at regular intervals below the pleura Artefacts from reverberations between probe and pleura	Seen in normal lungs as well as pneumothorax and emphysematous lungs
B-lines	Figure 1	Hyperechoic artefacts that originate at the pleural line and extend from the probe to the edge of the screen, without fading and perpendicular to the pleural line Artefacts that occur when the interstitium and alveoli are thickened predominantly from becoming oedematous with fluid	Presence of three or more B-lines per intercostal space is evidence of interstitial fluid. If seen diffusely in two or more zones bilaterally is usually indicative of pulmonary oedema
Z-lines	-	Hyperechoic artefact that originates at and perpendicular to the pleural line but does not extend to the edge of the ultrasound window and are shorter, wider and less defined than B-lines	Normal or pneumothorax
V-lines (spine sign)	-	Fluid acts as an acoustic window to enable visualisation of the V-line of vertebral bodies and the posterior thoracic wall in a supine patient	Pleural fluid
E-lines	-	Comet tail artefacts that are superficial to the pleural line	Echogenic foreign bodies or subcutaneous emphysema
Stratosphere sign	Figure 2	The loss of lung sliding beneath the pleura	Pneumothorax
Liver sign (mirror sign)	Figure 4	Tissue similar in consistency to liver tissue seen on US	Lung consolidation absent in pleural effusion
Sea shore sign (M mode)	Figure 2	Pleura appears as horizontal lines and the underlying lung as grainy, making up the sea and sandy shore, respectively	Normal M mode appearance of lung
Bar code sign (M mode)	Figure 3	Bar code-like appearance throughout M mode	Pneumothorax

Mid-clavicle lines

An anatomical illustration of a female torso from the chest to the waist. A dashed white horizontal line is drawn across the top of the image, passing through the highest point of the left breast. The text "Highest point" is written in white, bold font, centered over the line. The background is a light blue gradient with a subtle pattern of white dashed lines.

Highest point

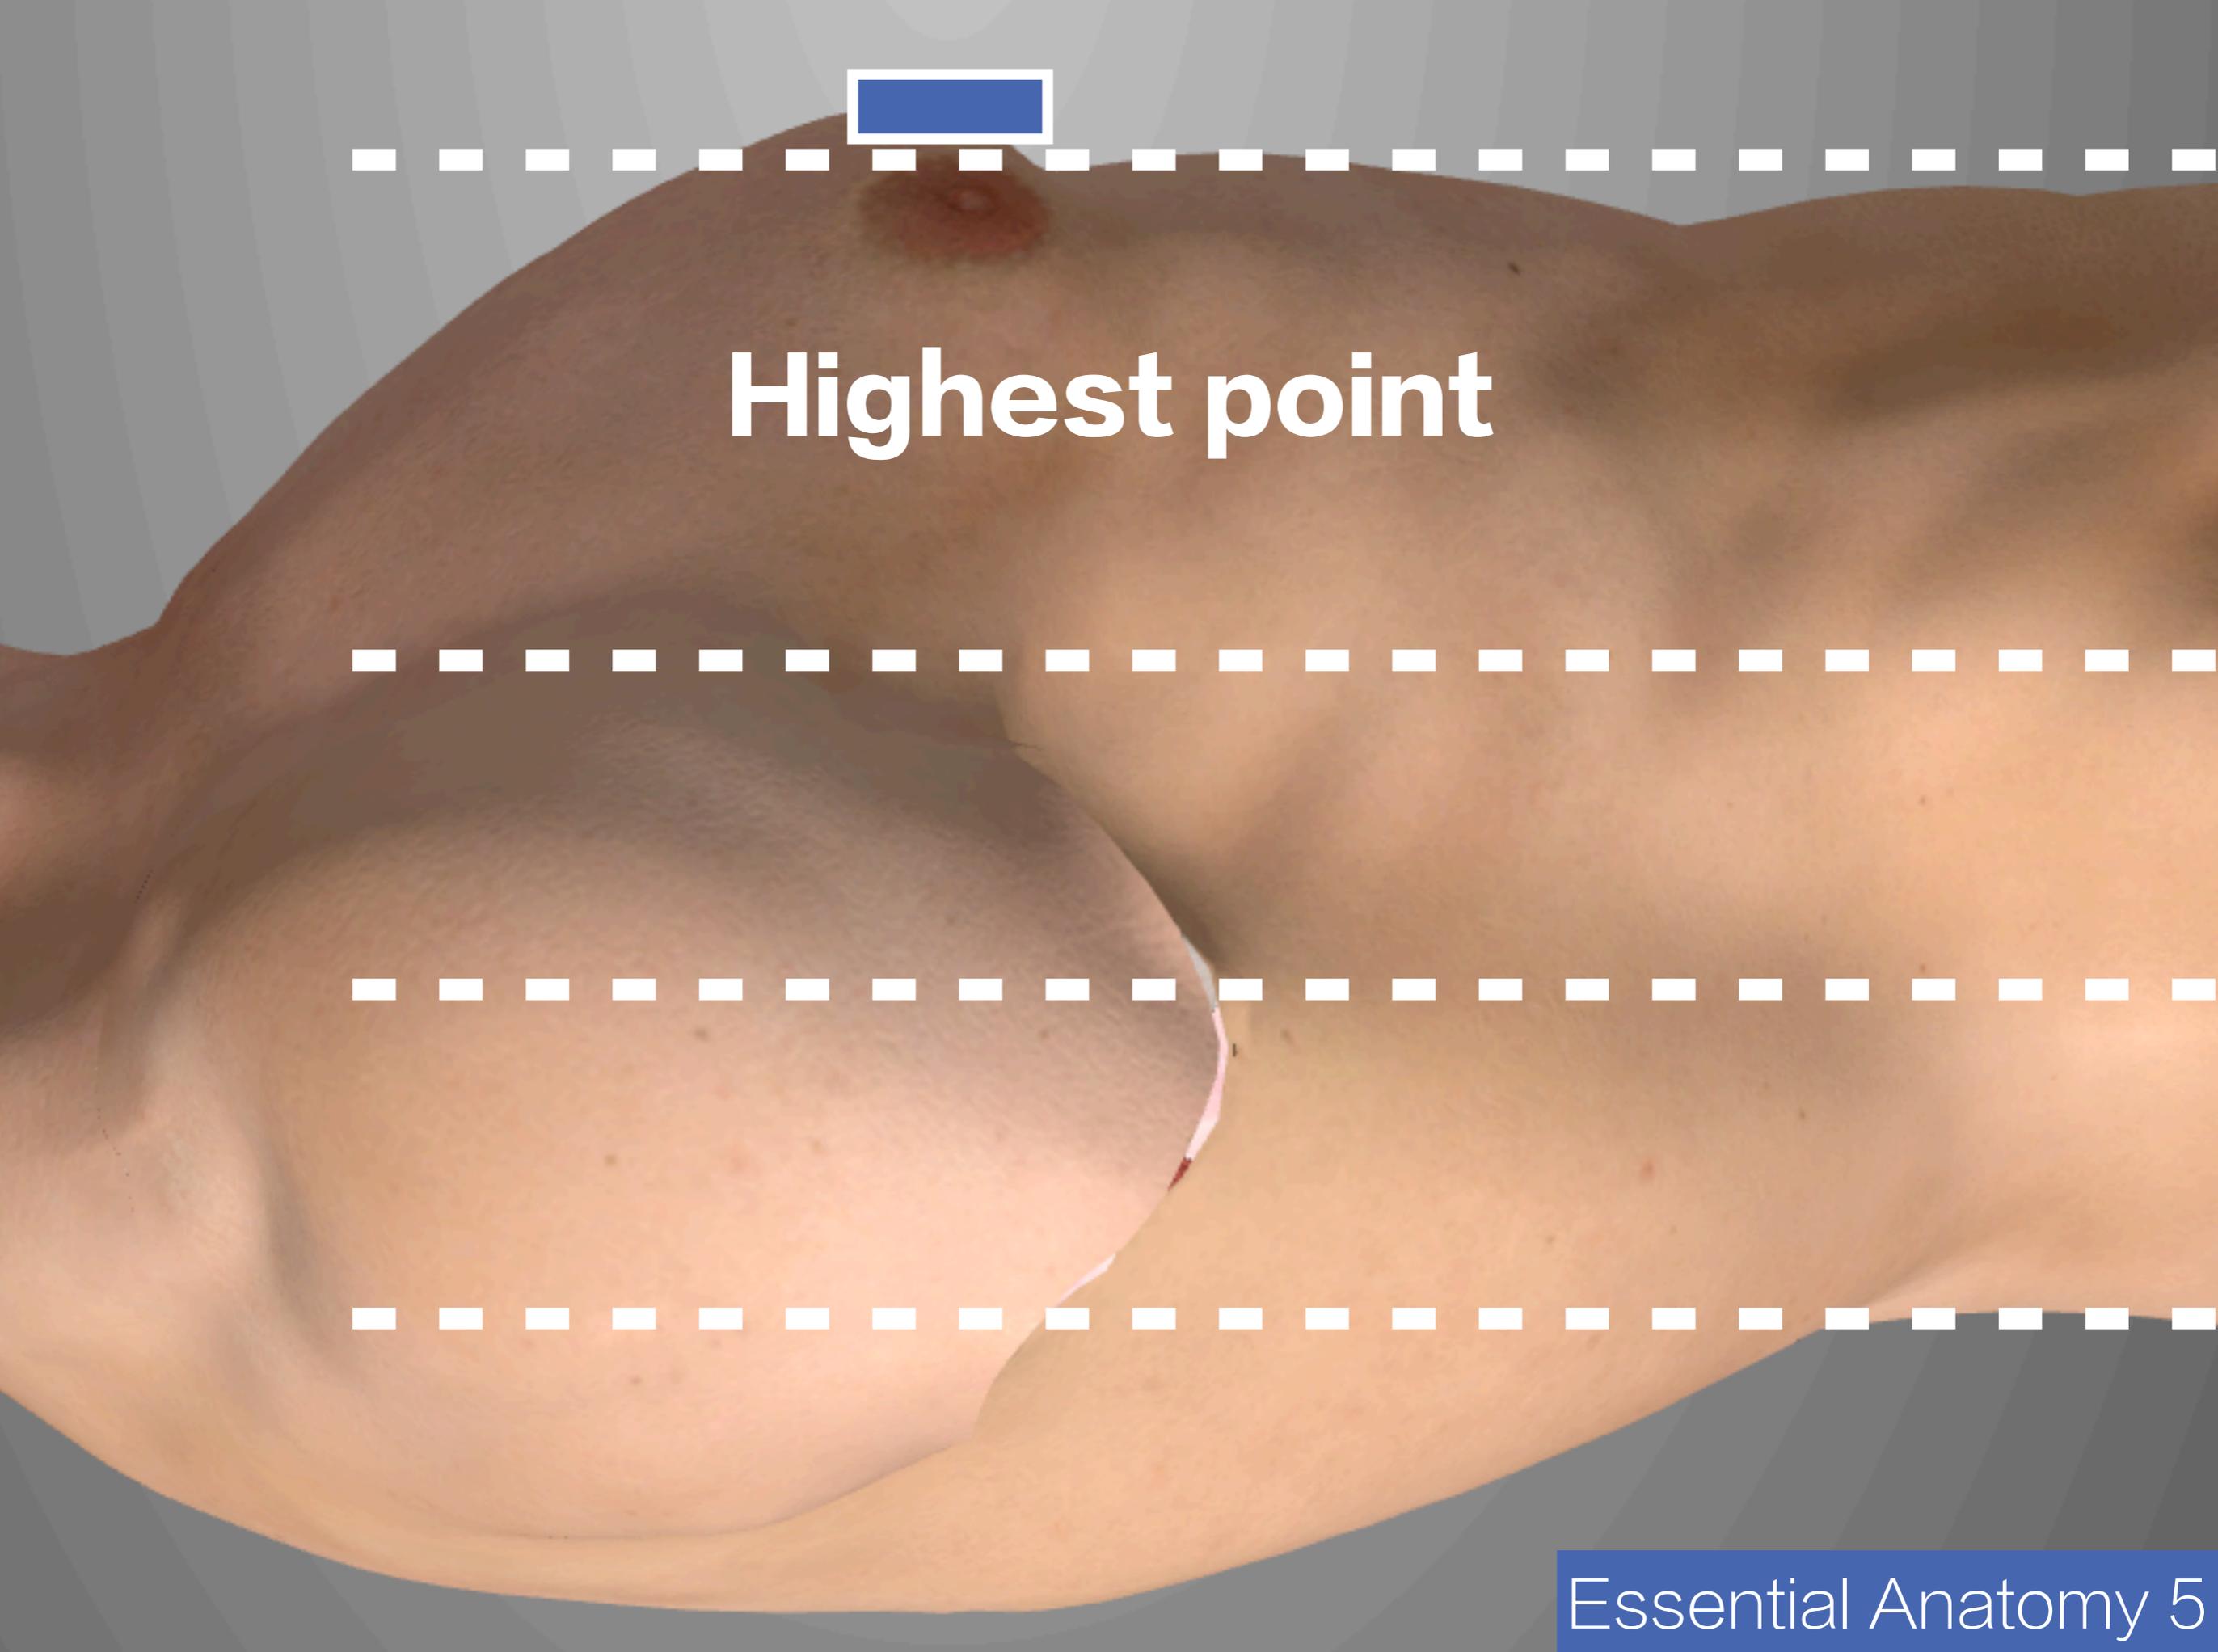

Highest point

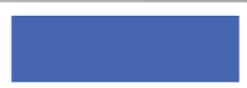

This anatomical illustration shows a lateral view of the human rib cage. The ribs are depicted as a series of curved, light-colored bones. A dashed white line is drawn horizontally across the top of the rib cage, indicating the highest point of the ribs. The text "Highest point" is overlaid in white on the ribs. The background is a light gray with a subtle grid pattern.

An anatomical illustration of a female torso from the chest to the waist. A dashed white horizontal line is drawn across the upper chest. A blue rectangular box highlights the highest point of the breast, which is the point of maximum projection. The text "Highest point" is written in white, bold font over the breast area.

Highest point

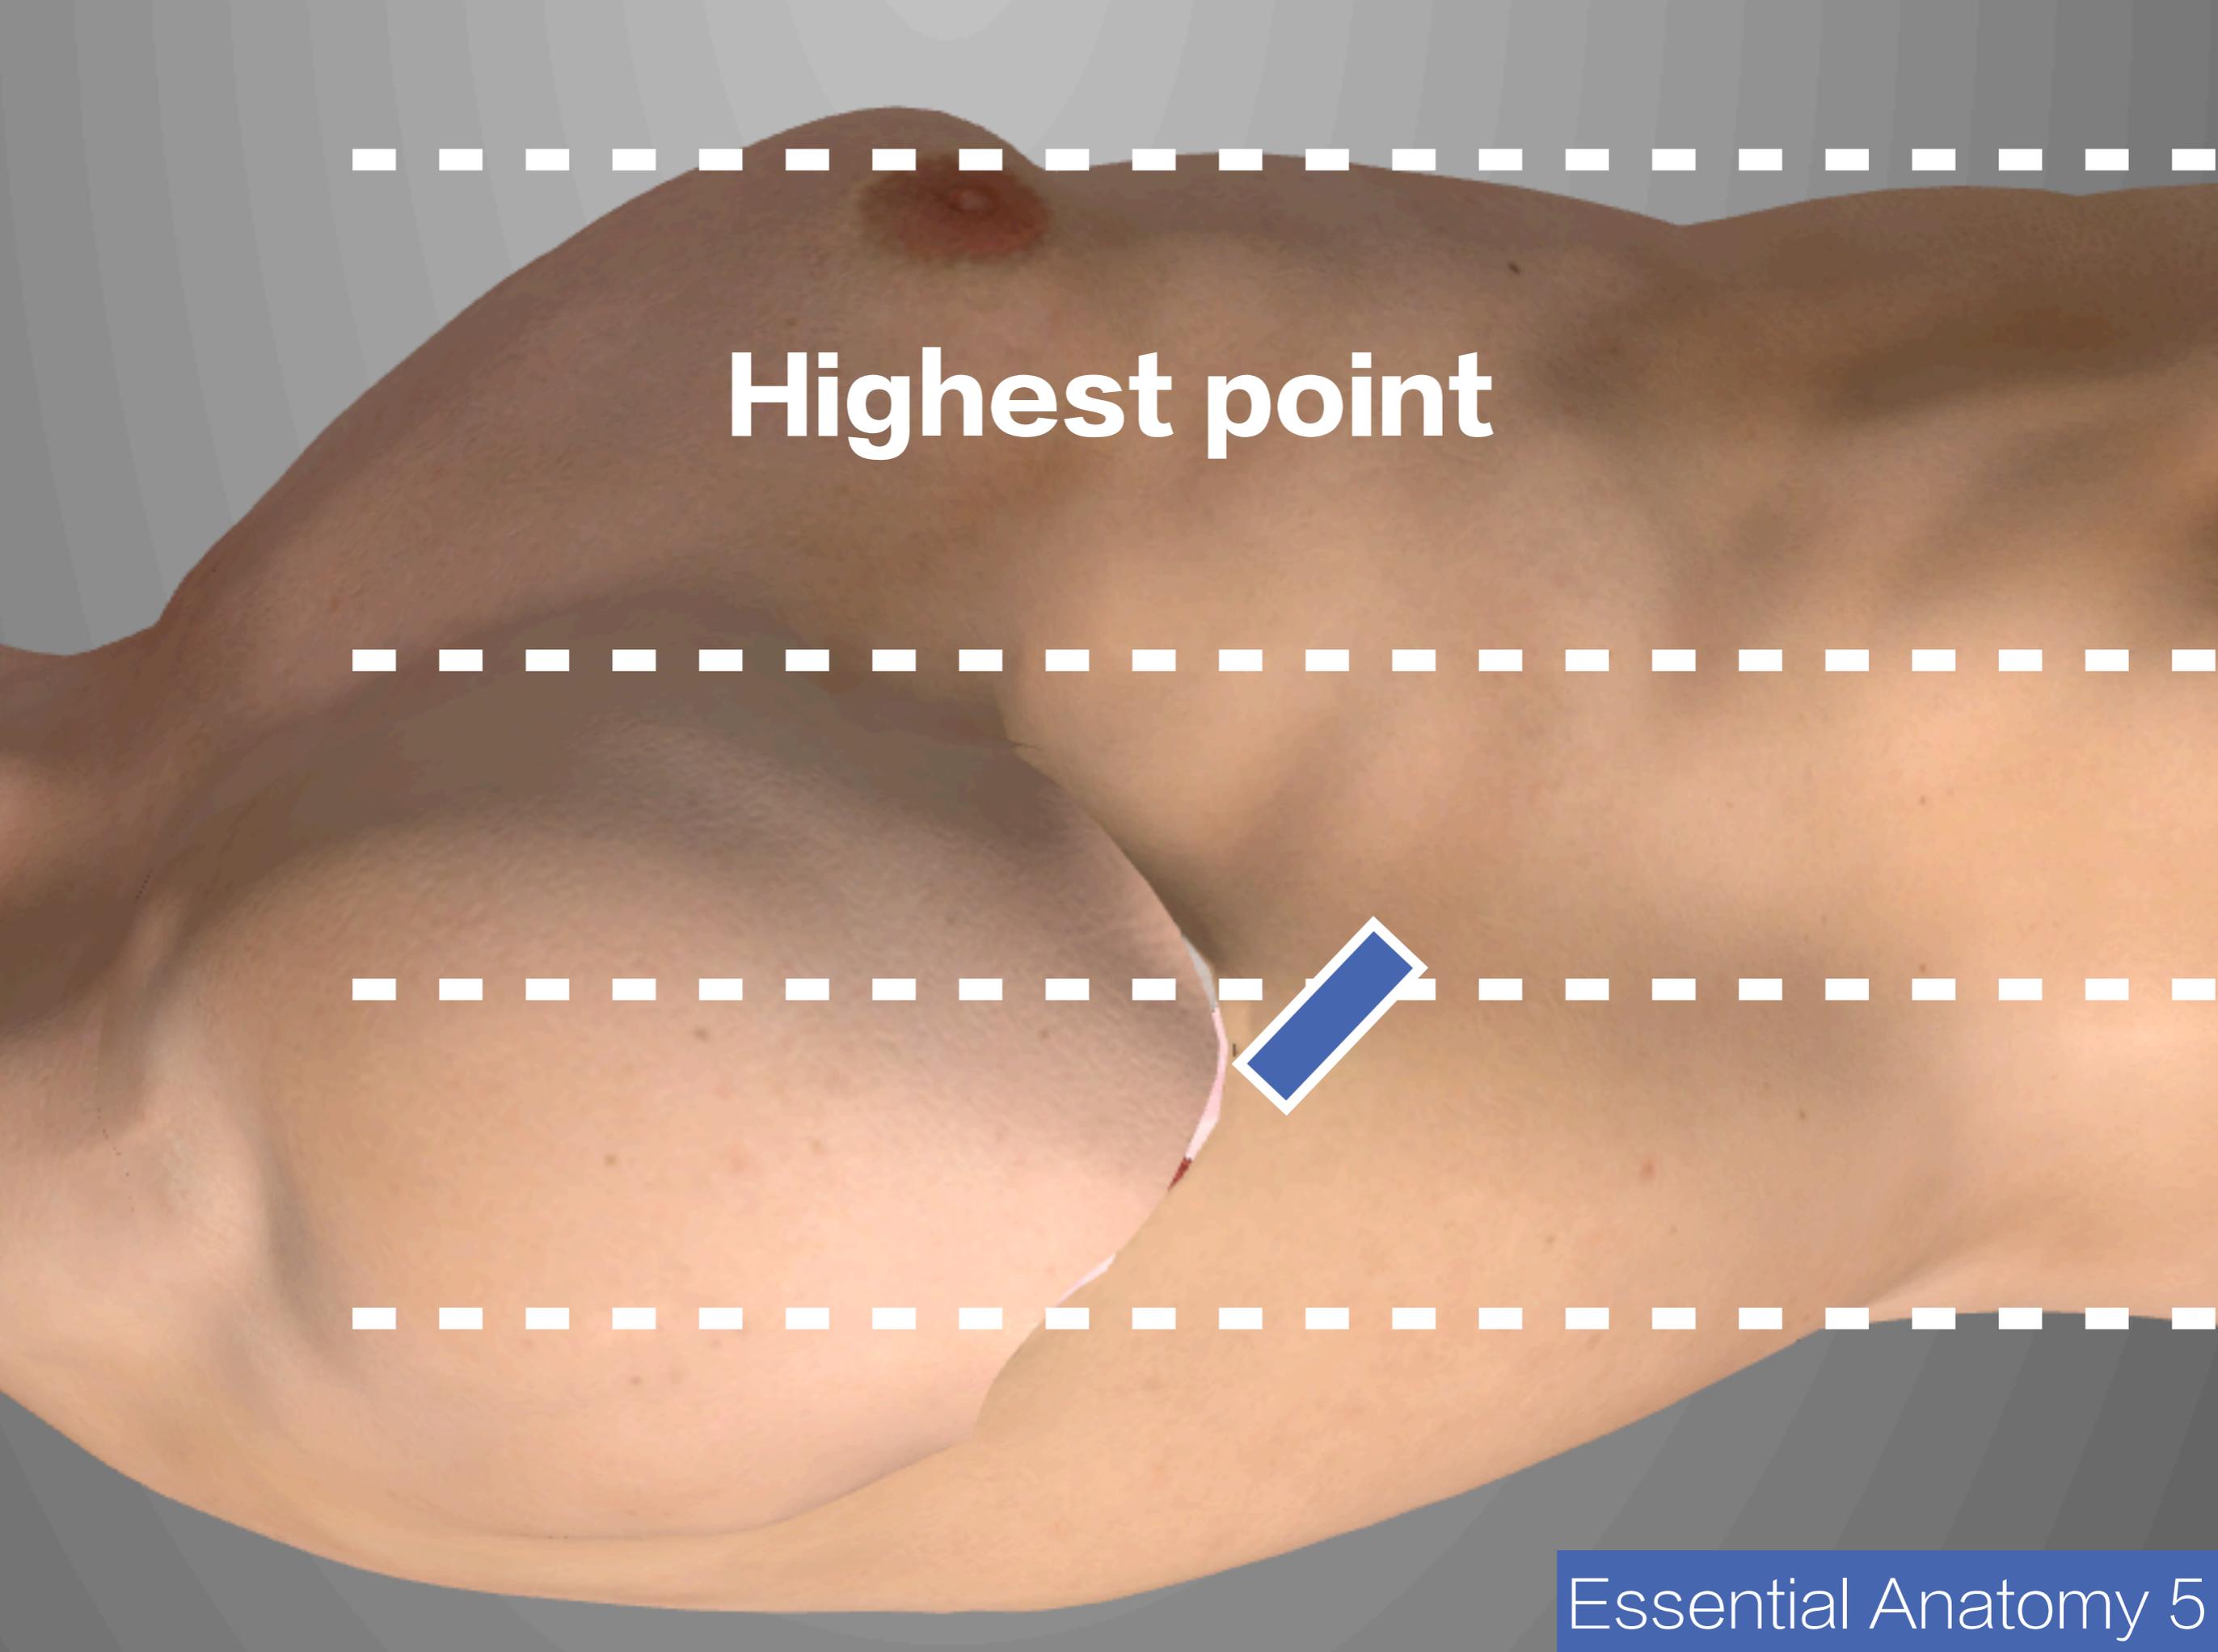

An anatomical illustration of a female torso from the chest to the waist. The left breast is shown in a lateral view, with a blue rectangular box highlighting the highest point of the areola. A dashed white horizontal line extends from this point across the entire width of the image. Below this line, three more dashed white horizontal lines are spaced evenly down the torso. The text 'Highest point' is written in white, bold font across the middle of the image, centered on the dashed line.

LUS for PTX: When ?

An anatomical illustration of the human thorax, showing the lungs, heart, and spine. The lungs are depicted in a light pinkish-red color, and the heart is shown in a darker red. The spine is visible in the center, and the rib cage is outlined. The background is a light, semi-transparent blue.

- **When suspect pneumothorax**
- **Cardiac arrest/ unstable patient**
- **Radio-occult pneumothorax**
- **Limited-resource areas**
- More accurately rules in PTX than supine CXR

- Fluid characteristics

A-line Pattern

Lung sliding? **YES** / **NO**

Lung pulse? **YES** / **NO**

Vertical artifact? **YES** / **NO**

PTX likely

Lung point? **YES**

PTX highly likely

Normal lung density at pleural line

Consider:

- PEEP effect/lung overinflation
- Lung pathology not reaching pleural line
- Early stages of lung pathology
- Performance of further tests

Diagnostic / **Nondiagnostic**

Increased Lung Density

- Increased lung weight (water, cells, pus, blood, proteins, connective tissue, lipids) and/or
- Lung deflation

B-line Pattern

Diffuse	Focal
Sonographic findings that may help in differential diagnosis	
<ul style="list-style-type: none"> • B-lines distribution (homogeneous/nonhomogeneous distribution) • B-lines "density" (B1 pattern; B2 pattern) • Decreased lung sliding • Decreased/increased lung pulse • Gravity-dependent or -independent pattern • Presence/absence of pleural line abnormalities • Presence/absence of subpleural abnormalities (e.g., focal consolidations) 	

Solid

Large area of lung consolidation	Small subpleural consolidation
Sonographic findings that may help in differential diagnosis	
<ul style="list-style-type: none"> • Distribution • Detection of air bronchogram(s) • Detection of fluid bronchogram(s) • Vascular pattern within the consolidation
